

The Standard in DAM Connectivity

Silicon Connector for Adobe Creative Cloud is a powerful extension to Adobe technology that enables direct linking from InDesign, Photoshop, and Illustrator to Cloud-based assets on web servers or in DAMs. Rather than creating copies of assets, Connector allows the DAM to serve as the sole system of record.

Key Features

- ✓ Comprehensive asset access for Adobe CC Applications. Users can preview, place, and update DAM-resident assets, all without leaving the application.
- ✓ Links, not copies. This means no more duplicating images or packaging entire projects just to share with others. File transfers are reduced to a fraction of their former size.
- ✓ Automatic in-app notifications: the whole team can stay current with the latest updates to every linked asset.
- ✓ Quick high-res/low-res toggling to speed up image-centric workflows and generate faster previews.
- ✓ Rich metadata searches that help users quickly find & link to just the right assets.

For InDesign, Connector offers a unique low-level linking to multiple assets in the DAM. When an asset changes, the user is alerted and the asset is automatically updated to the latest version. With Photoshop and Illustrator, single assets can be checked out, updated, and checked back in to the DAM.

Connector currently supports over 20 DAMs, and is quickly becoming the standard for connecting the Adobe Creative Cloud to top asset management systems, including:

Connector makes a huge impact on productivity for publishing and creative workflows. It can easily be extended with custom features, or integrated with other products from Silicon Publishing or our partners.
